

Pre-Wire Options

Home Connections is pleased to offer a complete range of structured wire products to the residential building industry. It is designed to support the growing need for technology in the home by integrating entertainment, communications, safety and automation products into a central enclosure. The systems are unique in offering an open architecture that gives builders the freedom to choose the specific products that meet the needs of their developments. This method also allows homeowners the opportunity to customize the basic system to fit their individual needs.

Drop Options:

Cable: Only the best quality RG6 Cables are used so you are ready for all the latest technologies like HDTV cable, HDTV off-air, satellite, cable, or antenna.

Back Feed: A back feed drop allows you to distribute one source throughout the house. For example, if you have a satellite receiver and you want to see that same satellite receiver's picture throughout the house, one back feed drop would allow that. We use the same high-quality RG6 cable and color code our wiring so there is no confusion on any future upgrades.

Phone: Only the latest in Cat 5e wiring is used so you are ready for complete flexibility now and in the future. Every jack in your home will be ready for up to 4-line analog capability and unlimited future digital phone technology.

Data: Speed and Convenience is name of the game with our Cat 5e enhanced wire. Whole house computer networking and high-speed internet access is what you get when you wire our data drops in your home. Also, ask us how you can turn your whole house into a wireless network with these drops. Move freely around your house with your laptop or pocket PC and access the internet as well as other computers in your home.

Security Camera: A camera requires two drops -- one for power and one for the camera picture. Camera drops allow you to integrate your camera picture throughout the house. For example, you can have a front door camera shot that can be viewed from any TV in the house.
